Introduction
- The global burden of disease due to uncorrected refractive error (URE) is accepted as significant 1. Data from a National Situational Analysis of Eye Care services and estimates of refractive error prevalence indicate an unmet demand for spectacle correction in Mozambique 2.
- To address this deficit in human resources, a key output of the Mozambique Eyecare Project is an undergraduate optometry course based at Universidade Lusíada, Nampula.

Methods
1. A World Health Organisation tool was used to conduct a situational analysis of eye health services in Mozambique 3.
2. For each province, a tool was completed by the Provincial Eye Health Director.
3. The results were combined with other data sets 1, 4, 5 to form the basis of an economic evaluation of eye care services in Mozambique.
4. Analysis of the data is ongoing.

Location
Data from the following provinces were used: South

Results
- Figure 3 below indicates the distribution of human resources (HR) by province. There are currently no optometrists working in the public sector.

- Figure 4 below indicates existing HR compared to what is needed to meet the V2020 target ratios.

- Figure 5 – Estimated number of people with VI or blindness due to URE

- The prevalence estimates were combined with economic data from various sources 1, 6.
- Following the methodology used by Smith et al. 7, GDP per capita can be used as a proxy measure of productivity.
- Disability weights were assigned to visual impairment to provide the estimate that the potential lost productivity resulting from the global burden of URE for Mozambique to be $14,486,692.

- This figure is adjusted for Labour Force Participation Rate (LFPR) 8 and Employment Rate (ER) 9.

- VI due to URE: 156,677, 30,175, 50,700, 550, 0.8275, 2.79, 14,486,692.

- This is a conservative estimate, calculated assuming that those who are 200 years old do not contribute to the national economy. Also the burden of presbyopia is not included, which would considerably increase this estimate.

- For every year there is not enough HR to address URE, $14,486,692 is a very conservative estimate of the cost incurred by Mozambique in terms of lost productivity.

Conclusions
- The situational analysis indicates a lack of eye health personnel who can and do refract. The logical course of action would be to train more eye health personnel.
- A conservative estimated annual burden of URE in lost productivity in Mozambique is $14,486,692.
- To achieve the V2020 target ratio, an extra 184 workers are needed in six provinces analysed.
- The analysis assumes the existing personnel are well trained and dedicate time to offering a refraction service. It also assumes that the patient receives the care they require. Other aspects of the situational analysis suggest this is currently not always the case. A more comprehensive analysis would look at the number of work hours each person dedicates to refraction and the outcome.
- Further research into the costs of training personnel needs to be conducted.
