The recent preliminary findings of this year’s census have shown a rise in the number of houses that have been newly completed. A little number crunching shows that the number of houses that were completed in this year, based on the average of 3,794 in the past 15 years, is expected to reach 6,347. This is an increase from 4,166 houses in 2016 and 2,850 houses in 2015. We have also seen a rise in the number of houses that have been newly completed.

The answer lies in the number of houses that have been newly completed in recent years. One reason is that the number of houses that have been newly completed has increased. From 2010 to 2012, the number of houses that were completed has been 5,936, 7,984, and 6,236, respectively. This increase is due to a number of factors, including government policies, the availability of financial incentives, and the increasing demand for housing. However, there are also other factors that have contributed to the increase in the number of houses that have been newly completed.

The number of houses that have been newly completed also varies by region. For example, in the Dublin region, the number of houses that have been newly completed has increased by 30% over the past five years, from 2,280 in 2011 to 2,960 in 2016. In contrast, the number of houses that have been newly completed has decreased in the Munster region, from 2,700 in 2011 to 2,400 in 2016.

In conclusion, the number of houses that have been newly completed has increased in recent years, and this trend is likely to continue in the future. The main factors contributing to this increase are the availability of financial incentives, government policies, and the increasing demand for housing. However, there are also other factors that have contributed to this increase, such as the availability of land and the availability of skilled labour.
