Abstract

This paper seeks to investigate the inner mechanics of policy change. It aims to discover how ideas enter the political arena, and how endogenous forces within the policy making environment transform ideas into new policies. The central hypothesis is that in times of crisis, new ideas emanate from a number of change agents, but in order for any of these ideas to enter the institutional environment, one specific agent of change must be present: the political entrepreneur. Without political entrepreneurs ideational change, and subsequent policy change, would not occur. The paper sets out a framework for identifying and explaining the endogenous drivers of policy change, and then tests this framework on two case studies, from two countries.
Introduction

‘How can we explain periods of relative stability, even inertia, which are then succeeded by often dramatic policy change?’ (Meijerink 2005, 1060). This is a problem that has vexed political scientists. Path dependence views institutions/policies as fixtures in social networks, providing stability (Clemens and Cook 1999), and while this provides a level of understanding as to how institutions/policies evolve, explaining change in this context has often relied upon exogenous shocks. However, Howlett (2009, 245) argues, ‘the idea that change occurs largely through exogenous shocks flies in the face of much evidence about the effects of policy learning or other endogenous sources of fundamental change.’

When Sir Ralph Harris, head of the Institute of Economic Affairs (IEA), suggested to Margaret Thatcher that the IEA had been advocating market reform and monetarism two decades prior to her election as Prime Minister, Thatcher quipped: ‘Ralph, the cock may crow but it’s the hen that lays the egg.’1 This captures our paper’s hypothesis that, in the context of an exogenous shock, in this case a crisis in the British economy in 1979, the political entrepreneur is the main agent of policy change. The political entrepreneur acts as a bridge between those developing/advocating new policy ideas – policy entrepreneurs (Kingdon, 1995), policy networks (Pemberton 2000) or other change agents (Hall 1993) – and the institutions implementing them. In the network of actors contributing to policy change, the political entrepreneur sits at the centre of the process. Without a political entrepreneur to inject the new ideas of policy entrepreneurs into the political arena at times of crisis, such as recessions, wars, or political instability, policy change will not occur (Hogan and Feeney, 2012).

Although the concepts of political and policy entrepreneurship have received attention in the literature, ‘the concept of policy entrepreneurship is yet to be broadly integrated within studies of policy change’ (Mintrom and Norman 2009, 649-650). To address this lacuna, our paper examines case studies from two countries experiencing economic crises during the mid 1970s and early 1980s. Such historical cross-national studies hold considerable promise for achieving a conceptual breakthrough in our understanding of policy change (Mintrom and Norman 2009, 662).

This paper initially discusses the institutional and policy change literature, then examines the various types of change agents, before setting out the hypotheses for identifying policy change and testing these against the selected cases. The conclusion highlights the paper’s significance and limitations.

Section 1: Institutional Analysis and Explanations of Change

The issue of policy change has often been addressed in political science literature by the concept of exogenous shocks. Crises are regularly blamed for destabilising policies. For instance, Greener (2001, 134) argues exogenous shocks result in new policy paradigms. Consequently, the policy change literature (Collier and Collier 1991; Mahoney 2001; Hogan, 205; Hogan and Doyle, 2009; Hogan and Cavatorta, 2013) has sought to perfect our identification of crises and critical junctures. But, the literature has not paid sufficient attention to the mechanics through which crises result in policy change.

The critical junctures concept was co-opted by path dependence scholars as a means of accounting for change. This is akin to the use of punctuated equilibrium in neo-Darwinian evolutionary theory (Gould and Eldredge 1977). Consequently, a regularly invoked interpretation of policy change has divided history into ‘normal periods’ and ‘critical junctures,’ during which major change is possible (Gorges 2001, 156). The concepts of critical junctures and exogenous shocks have sometimes been reduced to a deus ex machina to explain change that has proved otherwise inexplicable. Thus, exogenous explanations for sudden and dramatic shifts in policies tend to be crude. Orren and Skowronek (1994, 20) observe that punctuated equilibrium models ignore many of the characteristics of change and endogenous characteristics of change specifically. Thus, the problem here seems to be the use of exogenous shocks in a deterministic fashion that ignores endogenous entities - constituents such as policy and political entrepreneurs - who respectively generate and institutionalise emergent policy ideas. However, without the notion of exogenous shocks to initiate the change process, path dependence is reduced to an equilibrium model. Yet, at a time of crisis, if we can look within an institution for sources of policy change, in terms of idea generation and idea advocacy, we can avoid the necessity of having to rely exclusively upon exogenous explanations for policy change.

Crisis exposes decision makers to criticism and demands for more effective action (Walsh 2006, 492), resulting in policy change. Yet, sometimes crises do not result in policy changes. What accounts for this ambiguity? Walsh (2006) argues that policy change is most likely to occur when an alternative policy idea can explain past failures and secure the support of powerful constituents. It is to these powerful constituents, capable of generating and advocating alternative policy ideas, that we now turn.

Section 2: Agents of Change

The term political entrepreneur, as an explicit concept, was developed by Dahl (1961) (McCaffrey and Salerno 2011, 552). Dahl (1961, 6) contended that the political entrepreneur is the crucial agent of change, and ‘is not so much the agent...
of others as others are his agents.’ The political entrepreneur picks and chooses from policy ideas put forward by policy entrepreneurs at times of crisis and shapes the terms of political debate by influencing agendas and constructing cultural frames (Hwang and Powell 2005, 191). They ‘exploit moments of instability’ created by exogenous shocks and ‘invest resources in the creation of a new policy, or new forms of collective action’, having ‘transformative effects on politics, policies, and institutions’ (Sheingate 2003, 188-190).

Kingdon (1995) suggests change agents encompass a broad grouping of what he terms ‘policy entrepreneurs.’ When a policy is in difficulty, due to an exogenous shock for instance, windows of opportunity appear in which policy entrepreneurs challenge the existing paradigm (Kingdon 1995). They present a range of new ideas to replace the ones upon which existing policy is based and in the process vie for the attention of politicians to get their ideas into the policy-making environment. Policy entrepreneurs encompass civil servants, technocrats, academics, economists and interest groups etc., who engage in policy innovation, and have some access to decision makers.

Pemberton (2000, 777) identifies change agents as belonging to a policy network schema. In this case the policy entrepreneurs are essential for advocating new policy ideas to replace failing arrangements at times of crisis. However, the role of the political entrepreneur, willing to become an idea’s “champion,” is crucial. The result is the creation of coalitions among a variety of policy entrepreneurs and the political entrepreneur, whereby, ‘ideas facilitate the reduction of … barriers by acting as coalition-building resources’ (Blyth 2002, 37). Political entrepreneurs are the bridge between those advocating new policy ideas (policy entrepreneurs) and the institutions implementing them. As such, political entrepreneurs, by influencing agendas, shape the terms of political debate (Hwang & Powell 2005, p. 212). ‘Successful political entrepreneurs are able to consolidate innovations, producing political or social change that has enduring effects in the form of new programs, policies, or organizations’ (Hwang & Powell 2005, p. 214). This recognises leadership as a situational phenomenon, whereby leaders can take institutions/policies in particular directions (Wallis and Dollery 1997, 1-7). This paper contends that at times of exogenous shocks policy entrepreneurs and outside influences are responsible for producing new ideas, but the political entrepreneur acts as a figurehead, introducing these ideas into the policy process. The political entrepreneur, at the head of an entrepreneurial network of policy entrepreneurs, is capable of engaging in the process of creative destruction in relation to policy.

The relationship between policy and political entrepreneurs can be illustrated by the astronomical concept of a nebula, wherein the gravitational mechanics result in the clustering of particles to produce mass and eventually stars. Like such particles, there are always policy entrepreneurs with policy ideas,
swirling around in the policy making environment. In the wake of a crisis policy entrepreneurs vie for the attention of politicians to get their ideas into the policy-making arena. If a politician is willing to act as a political entrepreneur and champion a new idea they can draw policy entrepreneurs and other interests to them, building a mass of support behind the policy idea they are advocating (Figure 1). There are advantages for each side in the relationship. The political entrepreneur benefits from the expertise of policy entrepreneurs, to say nothing of their support, while the latter benefit from the politician’s “patronage” of their idea in the corridors of power. The more senior the political entrepreneur, and the more determined they are in advancing a particular policy the greater their entrepreneurial potential (Wallis and Dollery 1997: 3). Thus, the process of change is located in the interaction of ideas, actors and institutions (Hay 2004).

**Section 3: Framework for the Identification of Policy Change**

Existing explanations of policy change, while acknowledging the role of policy entrepreneurs, fail to integrate the separate concepts of policy and political entrepreneurship into their transformative frameworks (Mintrom and Norman 2009). This paper seeks to develop an understanding of the endogenous forces driving policy change, wherein the political entrepreneur, interacting with policy entrepreneurs, plays a crucial role. Building on the work discussed above, the paper hypothesizes that policy change occurs in three stages: initiation of the policy debate due to a crisis, ideational change, and the advent of the political
entrepreneur. The paper seeks to help explain why, in the wake of certain crises and policy failures, there is policy change, while at other times of crisis no change occurs.

We will measure the nature of policy change using the concepts of first-, second- and third-order change developed by Hall (1993). Hall (1993, 291) argues that exogenous shocks and policy failures can set off processes that lead to ideational change to the extent of resulting in the re-examination of the belief systems through which extant policy has been generated. Thus, this approach provides us with a useful tool for understanding degrees of policy change. In Hall’s (1993, 278) view, first order change, that is change to policy instrument settings, is a response to policy feedback. Whilst politicians are present in the core decision-making network, it is policy entrepreneurs who dominate this process. Second order change, that is change to the instruments of policy and their settings, is also driven by policy entrepreneurs, not politicians. In instances of both first and second order change the overall goals of policy remain the unaltered. However, in relation to third order change there is change in the instrument settings, the instruments themselves and the hierarchy of goals behind policy (Hall 1993, 278-279). In this case it is politicians, and not policy entrepreneurs, who dominate the process. ‘Such wholesale changes in policy occur relatively rarely’ (Hall 1993, 279).

The Initiation of the Policy Debate

Crises or exogenous shocks are often cited as explanations for policy change (Greener 2001; Golob 2003, 373) as their existence highlights a failing within existing policies due to their implication in, or inability to right, the emergent situation (Levy 1994). In order for policy entrepreneurs to challenge existing arrangements, a crisis and policy failure must be identified, and widely perceived (Hay 1999, 324). Agents must diagnose, and impose on others, their notion of a crisis before collective action to resolve the resultant uncertainty can be taken (Blyth 2002, 9). By shaping ‘the terms of political debate: they frame issues, define problems and influence agendas’ (Sheingate 2003, 188). They ultimately initiate a debate concerning extant ideational orthodoxy.

In terms of macroeconomic shocks, Garrett (1993, 522) suggests ‘most scholars agree that severe recessions make significant structural changes possible because they render politics highly fluid’. A crisis can call into question existing policies, bringing about the possibility of change (Tilly 1975). Accordingly:

**Hypothesis 1:** A crisis/exogenous shock will initiate debate concerning existing policy arrangements.
Ideational Change

Once a crisis is identified the failure of a prevailing policy paradigm drives policymakers to look outside government for a solution (Oliver and Pemberton 2004, 419). Ideas influence policy by acting though particular actors who promote an idea and build a supporting coalition (Berman 1998, 14-22). As policy entrepreneurs are team players they can constitute an ‘entrepreneurial network’, the composition and size of which can demonstrate the support for an idea (Mintrom and Norman 2009, 653). The triumph of a new idea from policy entrepreneurs depends upon ‘a workable new idea being available’ which a political entrepreneur is then prepared to promote (Oliver and Pemberton 2004, 419). Such ideas determine the path of subsequent policy, as policymakers work within a framework of ideas and standards that specify not only the goals of policy, but the instruments to be used to achieve these goals, and the nature of the problems they are meant to address (Hall 1993, 279).

Policy entrepreneurs function as a link between problems and the policies introduced by political entrepreneurs to resolve those problems. Political entrepreneurs’ co-ordinate the policy entrepreneurs, encouraging them to coalesce around a decipherable set of alternative ideas, they are the link between the innovation of the policy entrepreneurs and policy change. Thus, the political entrepreneurs are the drivers of creative destruction.

According to Legro (2000) extant ideational collapse and new ideational consolidation are components of the ideational change process. Should a range of policy entrepreneurs agree that the prevailing paradigm is inadequate ideational collapse will occur (Legro 2000, 419). In the wake of ideational collapse, the issue is reaching consensus on a new set of ideas. Legro (2000) argues that if consensus is achieved we will then see change agents co-ordinating a replacement set of ideas to the reigning consensus. However, ‘failure to reach consensus on a replacement could still produce continuity, as society reflexively re-embraces the old orthodoxy’ (Legro 2000, 424). Walsh (2006, 494) sees this as the continuation of failed policies due to a lack of coherent intellectual links between policy tools and desired outcomes. In the wake of ideational collapse, a new idea will be adopted if an identifiable political entrepreneur is present to champion it, and the idea itself is politically intelligible – as Thatcher suggested: the cock may crow, but there must be a hen to lay the egg. Consequently:

Hypothesis 2: Policy failures will lead to underlying ideational collapse as policy entrepreneurs (entrepreneurial networks) critique the current model and generate replacement ideas, which they will consolidate around if a political entrepreneur is present, resulting in ideational change.
Without a political entrepreneur acting as a type of ideational figurehead/catalyst, this new idea will not enter the institutional environment.

**Policy Change**

Hall (1993, 291) argued that exogenous shocks, and policy failures, discredit the old paradigm, leading a re-examination of the belief systems through which that policy was created. We pointed out above how he describes rare, but radical, and overarching changes in policy as third order changes. As we argue that political entrepreneurs are necessary for such paradigm shifts to occur, we are effectively using third order change as the threshold for evaluating the presence of political entrepreneurs. This is because political entrepreneurs exploit the uncertainty created by crises (what Blyth (2002) terms as Knightian uncertainty), and ‘search for that mix of interests and appeals that can produce a winning coalition’ to generate major change (Sheingate 2003, 192). For new ideas to overthrow extant policies the political entrepreneur must occupy a position enabling them challenge existing arrangements. Political entrepreneurs can be leaders of the governing party, or an opposition party, though Oliver (1997, 144-145) suggests that for a political party a period in opposition can be conductive to social learning, allowing it be more open to new ideas. For an idea to triumph political entrepreneurs act as ideational coordinators, bringing a broad array of policy entrepreneurs in the entrepreneurial network together in a coalition for ideational and policy change. Without a political entrepreneur to inject new ideas into the policy making arena, third order/paradigm change (Hall 1993) will not occur, as no agents within the entrepreneurial network possesses the necessary access to existing institutional arrangements to implement such change. Instead, there may be a first order policy change (change to the policy instrument settings), or a second order policy change (change to the setting and instruments of policy).

Consequently:

**Hypothesis 3:** *Third order (paradigmatic) policy change will result if a political entrepreneur injects the ideas espoused by an entrepreneurial network into the political environment.*

While policy networks constitute a particularly important intermediate variable in enabling policy change (Pemberton 2000), the political entrepreneur is the “crucial element”.

**Section 4: Methods and Country Selection**
Comparative historical analysis has sought to provide temporally grounded accounts of diverse topics in the social sciences including policy change. This approach is ‘defined by a concern with the use of systematic and contextualized comparison’ (Mahoney & Rueschemeyer 2003, 3). By examining the nature of economic policy change at the national level in two countries, namely Sweden and the United State (US), this paper seeks to add to the extant literature made up of mostly individual country examinations that often juxtapose different levels of policy change (Howlett & Cashore 2009).

Sweden in the mid 1970s and the US at the beginning of the 1980s constitute interesting cases. Each country appeared to have reached a turning point in their histories at these times. In Sweden, the years immediately following the oil crisis of the early 1970s were marked by both recession and stagflation, as the economy struggled to maintain the welfare state (OECD 1978). In a context of declining economic competitiveness, rising unemployment and a widening budget deficit there were worries that the Swedish Model of free enterprise coexisting with an expansive welfare state could no longer survive (Fulcher 1991, 267; Mjoset 1992, 347). By the early 1980s, the US was locked in economic stagnation (Dark 2001, 114). Stagflation led to a deep soul searching as to the country’s economic future (Divine et al. 1995, 569). There was a sense that the federal government lacked an understanding of how this problem might be resolved (Spulber 1995, 41).

In both countries there was deep anxiety – a questioning of past decisions married with uncertainty as to how to proceed. In a sense, they were experiencing existential angst. To many Swedes the Swedish Model appeared unsustainable by the mid 1970s, while for Americans the central tenets of the American Dream seemed to have foundered.

In addition to having reached a crossroads in their development, the countries were selected using a combination of most-similar and most different criteria, where similar and different independent variables are focused upon. Using the most similar case selection method, the same independent variables are chosen, while employing the most different technique dissimilar independent variables are selected (Gerring 2007). The US and Sweden share the overarching criteria of being long-standing democracies and capitalist states. The specific criteria were stable democracy since the first half of the twentieth century, and founding membership of the Organisation for Economic Cooperation and Development (OECD), conditions uniting the principles of representative democracy and the free market. Thus, we are examining the nature of macroeconomic policy change, within the context of different temporal boundaries (Gerring 2007, 20), at the national level. These countries are most different according to Lijphart’s (1999) categories of majoritarian and consensual democracies, allowing us to control for varying institutional arrangements.
Additionally, while the US is a federal presidential republic, Sweden is a constitutional monarchy. Both countries’ economies’ performances, and the policies governing them, varied during the 20th century.

The case studies’ similarities ensure “the contexts of analysis are analytically equivalent,” while their differences place “parallel processes of change in sharp relief” (Collier 1997, 4). The value of such cross national studies, historical in context, is that they offer the prospect of conceptual breakthroughs in our understanding of policy change (Lieberman 2001).

Section 5: Evaluation and Discussion

Sweden – 1976

The Economic Crisis

By the 1970s Sweden was straining under the burden of supporting its welfare state (Time 1976a, 9). Increased international competition, stagnating demand, and recession following the oil crisis of 1973, led to decline in the steel and shipbuilding industries (Lundberg 1982, 199). The industrial sector shrank relative to other parts of the economy. Annual productivity growth, having increased at 4.1 percent per year between 1950 and 1973, dropped to 1.4 percent thereafter (Forseback 1976, 29). The public sector’s share of GDP rose and the number of public sector jobs, increased to maintain the image of full employment, came to outnumber those in private industry after 1978 (Gress 1991; OECD 1992, 62). Lindbeck (1997, 1312) argues that sluggish productivity growth was, to some extent, the result of the increasing size of public sector.

By 1976, most economic indicators were pointing downwards. Sweden’s unemployment rate averaged 2 percent during the 1970s, double that experienced in the 1960s (OECD 1977, 5). ‘But the maintenance of high employment had been accompanied by less favourable performance in other areas, notably costs, prices and the balance of payments’ (OECD 1977, 42). Inflation was double that of the previous decade, with the oil crisis contributing to prices’ upward trajectory. ‘In the 1970s, wages exploded in a self-destructive series of agreements that placed Swedish firms in the un-competitive position of having the highest paid labour force in the world’ (Ahlén 1989, 333). The balance of payments also deteriorated sharply (OECD 1976, 19). The economy’s growth slowed to 1 percent in 1976, from 2.5 percent the previous year, before contracting in 1977 (O’Connor, O’Malley and Foley 1978). The government’s purist of counter-cyclical fiscal policies resulted in the budget deficit expanding significantly (Siven 1984), with the national debt tripling within a decade (OECD 1982, 16).
Extant Ideational Collapse

During the 1970s, elections were dominated by concerns over social welfare, employment, taxation and nuclear power. As the 1976 general election approached, the Social Democratic Workers’ Party, Socialdemokratiska Arbetarepartiet (SAP) noted declining support (Hadenius 1997, 121). The previous three years had been marked by parliamentary deadlock – due to a close 1973 election. In 1976 the Swedish Trade Union Confederation, Landsorganisationen i Sverige (LO), proposed a wage earner fund, through a levy on corporate profits, to transfer control of enterprises with more than 50 employees to the unions (Esping-Andersen 1992, 59). But, the SAP retreated from the idea due to the opposition of the Swedish Employers’ Federation, Svenska Arbetsgivarforeningen (SAF) (Whyman and Burkitt 1993, 612). The non-socialist parties, ‘at last with an issue around which they could collectively mobilise’, argued that the wage earner fund proposal demonstrated the SAP wanted state dominance in the business sector, whereas the Swedish model had been built on co-operation of both sides of industry with a neutral state (Blyth 2002, 207). The unions seemed to be moving further to the left, away from an accommodation with capitalism and towards outright socialism, while their political allies in the SAP were shifting to towards the centre. The SAP was also criticised from the left by the Left Party Communists, Vänsterpartiet Kommunisterna (VPK), due to unprecedented unrest in the labour market. This situation, rife with unfulfilled economic expectations, and change agents dissatisfied with the prevailing circumstances and paradigm, constituted ideational collapse.

The Failure of New Ideational Consolidation

The deadlock in Parliament between the 1973 and 1976 elections created political uncertainty, while the three non-socialist parties (Centre, Liberal, and Moderate) became more skilled at presenting a united front in election campaigns and Parliament (Time 1976b, 32). The 1976 election campaign saw the non-socialist parties unite under the leadership of Thorbjörn Fälldin of the Centre Party (Back et al. 2009). Fälldin depicted the SAP government as advocates of an unwieldy, inhuman society that accorded higher priority to growth and profitability than to other, more important values, such as the environment and individual freedom. Time (1976b, 32) pointed out that the growing concentration of state power and fear of the over bureaucratisation of society through the wage earner funds, were the non-socialists’ targets. This election, resulting in only small shifts in the relative strength of the socialist and non-socialist blocs, saw the defeat of the SAP
after having ruled Sweden for 44 years. The combination of the Centre, Liberal, and Moderate parties won a five seat majority in parliament. ‘The Swedish model has gone in for repair,’ proclaimed the Financial Times.3

The discussions surrounding the election and economy did not result in the emergence of alternative economic ideas to the existing ones, or a significant change agent – a political entrepreneur. The SAF acted as a policy entrepreneur to the extent that it sought to stop wage earner funds, but that was all. No other significant policy entrepreneurs were present. No political leader was prepared to advocate an alternative to, or an end to, social democracy. The non-socialists had been out of power for almost half a century, so the last thing they wanted was dismantle the welfare state built up by the LO and SAP, for fear of another half century in opposition. Thus, in spite of the dominant economic orthodoxy’s failure to meet the challenges of the post oil crises world, the non-socialist parties proved both unwilling and unable to create a coalition around alternative ideas to social democracy. They wanted to show the public that the welfare state was safe with them.

First Order Policy Change

The SAP’s election defeat only resulted in what could best be described as “business as usual” for the welfare state. The new Prime Minister Thorbjörn Fälldin, in order to form a coalition out of the non-socialist parties, backed away from anything that might generate controversy.4 For instance, his re-election promise to rapidly dismantle nuclear power plants was shelved5, as both the Liberals and Moderates supported the construction of more such facilities (Time 1976a, 9). Such constraints on the ability to implement election promises had severe consequences for the government’s lifespan. Ironically, there followed, under the non-socialists, an expansion in spending to reanimate the sluggish economy, as well as increases in sick pay, funding for child-care centres and food subsidies.

Nevertheless, the employers, encouraged by the SAP’s defeat, launched an ideological and political counter-offensive against the trade union movement (Whyman and Burkitt 1993, 606). In contrast to the 1930s, the balance of power gradually shifted in the SAF’s favour. However, no change to social democracy nature of the state occurred after 1976. ‘When the non-socialists came to power they said they would run the social democracy better than the Social Democrats

---

had,’ observed Sten Westerberg. Fälldin assured Swedes that he had no intention of repealing any of their social benefits, and instead promised to try and better them (Hadenius 1997). The new government continued to consult regularly with the union movement and the LO’s representation on government committees and commissions was the same after 1976 as before. But, Fälldin did interpret the election as a mandate to break the concentration of power in the state's bureaucracy and to halt experimentation with new social programmes.

The new administration, eager to prove it would not wreck the welfare state, took measures to ease the structural problems industry faced. Certain firms in difficulty were nationalised while others received subsidies (O’Connor, O’Malley and Foley 1978, 3). The support of employment in iron ore, steel, and shipbuilding meant preservation of inappropriate structures of production. Unemployment also continued to be concealed by expanding public works, training programmes, and the public sector (Statistisk Arsbok 1982-83). ‘The results were predictable, the budget and external current account went deep into deficit, and inflation rose’ (Delsen and van Veen 1992, 94).

After two years trying to find a solution to Sweden’s nuclear power issues the Fälldin government resigned. It was replaced by a Liberal minority government, with Ola Ullsten as prime minister. This government lasted for just under a year. The 1979 general election saw the non-socialist parties take 49 percent of the vote and win the election by just one seat. Thorbjorn Fälldin returned as prime minister. However, on many issues the non-socialists remained divided (Peterson 1987, 33). Consequently, the coalition could not agree on a set of policies to counteract the deteriorating economic situation (Olsen 1984). Not only were they unable to make significant reductions in public expenditure, but their rule coincided with a particularly difficult time for the economy. The irony was that the right wing administrations had nationalised and subsidised weak industries, something the SAP had resisted (OECD 1978, 21). This failure to improve the economy led to disenchantment amongst the electorate. All the non-socialist governments seemed to want was to maintain social democracy by whatever means necessary (Callaghan 2000, 125).

In this case, economic policy instrument settings changed (first order policy change), but the instruments of economic policy, and the goals behind it, remained much the same (Hall 1993).

| Hypothesis 1 – crisis to initiate debate concerning extant policy | Yes |
| Hypothesis 2 – ideational change (extant ideational collapse and innovation) | No |

---

The economic crisis in Sweden failed to generate a significant level of debate on alternatives to social democracy. While extant economic policy was perceived as failing, change agents did not consolidate around a replacement orthodoxy. This was primarily due to the absence of policy entrepreneurs putting forward alternative ideas to social democracy and a political entrepreneur willing to champion alternative ideas in the policy making environment (Figure 2). Despite an economic crisis, criticisms of social democratic policies and their underlying theories, and a change of government from SAP to a liberal coalition, this orthodoxy endured. No political party leader, nor party, was willing to take on this pillar of Swedish society for fear of electoral suicide. ‘Apart from disavowing wage earner funds, the bourgeois parties offered no real alternative to SAP policies’ (Blyth 2002, 207). Ironically, the non-socialist coalitions went further than the SAP in supporting industries in difficulty and ultimately failed to adjust the expectations of the electorate to Sweden's straitened circumstances.\(^7\)

**Figure 2:** The absence of political entrepreneurs in Sweden 1976

\(^7\) The Financial Times, 29 September, 1982, p. 16.
The last year of President Carter's administration was marked by rising unemployment and high interest rates (OECD 1982). ‘Washingtonians joked that [Carter] was the first President with poll ratings lower than the prime interest rate’ (Boller 1996, 355). The president's implementation of the Credit Control Act had the effect of reducing borrowing, and putting a dampener on economic growth (Hall 2003, 172). By 1980 inflation reached 13.5 percent, its highest level since 1946, while GDP growth contracted (Mitchell 1998). The nonpartisan National Bureau of Economic Research (NBER), with a reputation for declaring when recessions start and finish, announced that the US economy was in recession (Time 1980a, 48). The Economic Report of the President 1981 showed an administration ready to ‘throw in the towel’ on the economy (Spulber 1995, 41). There was criticism of Carter’s plans to stimulate the economy (Biven 2002, 27). ‘Too little, too late, too political,’ complained Murray Weidenbaum of Washington University, providing ‘the opposite of what the ailing economy needs’ (Time 1980b, 34). Teaster (2004, 45) points out that by late autumn Federal Reserve Chairman Paul Volcker acknowledged that the economy was in recession. The problem was that the Fed, in tightly controlling the money supply, caused interest rates to reach their highest levels in a century. The effect was to reduce borrowing and send spending into decline (Weidenbaum 2011, 98). Thus, the combined actions of the Federal reserve and the White House plunged the economy into the recession that they had both been trying to avoid (Dark 2001, 120). Volcker's advocacy of a tightened money supply in order to reduce inflation constituted a move towards monetarist policy (Krugman 1990). However, the American public was very dissatisfied with the government's performance.

Extant Ideational Collapse

The president's policies to reduce inflation, in order to revive the economy and ensure his re-election, instead contributed to reduced consumer borrowing, economic stagnation and his subsequent election defeat (Sherman et al 2008, 623). The news media, such as the Washington Post, began to openly declare that the economy was in a serious recession (Hargrove 1988, 102). Economists were generally of the opinion that there was little likelihood of an economic recovery in the medium term. ‘The great stagflation swamp’ was how Walter Okun (1997) termed the situation. Alan Greenspan, a future chairman of the Federal Reserve, observed that as a consequence of the economy's stagnation President Carter found himself forced into an emergency programme of restraint, leading to a rapid rise in unemployment (Bilhartz and Elliott 2007, 235). A result of this situation was that economists, and other policy entrepreneurs, began to gradually advocate a paradigm that they believed was capable of correcting the problems in the economy: monetarism.
Various conservative think tanks, such as the American Enterprise Institute (AEI) - a strong proponent of the free market since the late 1930 - had been advocating monetarist ideas, as had economist such as Milton Friedman, Karl Brunner of the University of Rochester, Arthur Laffer, Alan Meltzer of Carnegie Mellon University, Robert Lucas and also the economic staff of the Federal Reserve Bank of St. Louis. (Blyth 1997, 236-237; Weidenbaum 2011). Institutions and economists of this perspective worked hard to ensure that economic journalism in the media, in newspapers such as the Wall Street Journal served as a conduit for their ideas (Blyth 1997, 237). The late 1970s also saw a group of mostly Republican Congressmen and staffers advocating what became known as supply side economics (Hogan 1990a, 137). With policy entrepreneurs generally in agreement as to the inadequacy of the extant paradigm, ideational collapse had occurred.

New Ideational Consolidation

The Republicans nominated Ronald Reagan as their candidate for President. Adopting the role of a political entrepreneur, he embraced the ideology of the New Right: a cultural conservatism stressing social and moral issues, and advocating supply side economics. His campaign was to be change orientated. This was emphasised in a campaign speech in Chicago advocating the Kemp-Roth economic formula (Hogan 1990a, 139). He had a simple message: low taxes, reduced spending on social services, balanced budgets, and fewer government regulations. Advocacy of supply side economics fit particularly well with Reagan’s view that the citizens could resolve the country’s problems if there was less governmental interference in their lives (Wallison 2003, 59). Reagan urged a bold programme of tax reductions, spending restraints, and regulatory reforms that would inject new life into the economy (Hogan 1990b, 228). Where Barry Goldwater had failed in 1964 Reagan was convinced he could triumph in 1980 (Hirsh 2010, 60).

Reagan lay the blame for the recession at the door of the president, saying that Carter's policies had stifled productivity, while increasing both inflation and unemployment (Hirsh 2010). Reagan succeeded in building an electoral coalition around the concept of monetarism and won the 1980 presidential election on the back of advocating a marked set of alternative economic ideas which could used to supplant extant arrangements (Blyth 1997). Reagan's election victory, and the Republican's regaining control of the Senate for the first time since 1954, were seen as providing a mandate for monetarist policies (OECD 1982, 10). In the midst of an economic crisis there was a collapse in confidence in the dominant economic orthodoxy. Various economists, think tanks, and other interest groups,
acting as policy entrepreneurs and advocating monetarist economic ideas, consolidated around Reagan in the role of a political entrepreneur. This acceptance of monetarism as a viable alternative orthodoxy constituted ideational change.

Several economic, ideological, and social trends contributed to Reagan’s appeal. The 1970s witnessed growing middle class opposition to the taxes necessary to sustain programmes such as social security. This burden became greater as the economic depression deepened, leading to a questioning of existing policies and their underlying ideas.

**Third Order Policy Change**

Reagan utilised anti-government sentiment to his advantage, emphasising the importance of individualism, and a smaller role for the federal government. The monetarist proposals of policy entrepreneur Arthur Laffer played a large role in Reagan's economic strategy. To the problem of stagflation he promoted a seemingly straightforward remedy: tax cuts, wherein the resulting stimulus would boost the federal government's revenues to balance the budget, consequently reducing inflationary pressure (Dallek 1984, 64-67). Reagan’s uncomplicated patriotism acted as a balm to the wounded national psyche. However, the victory of New Conservatism was also driven by the challenge to America’s economic hegemony by West Germany and Japan. President Reagan's new economic programme, dubbed Reaganomics by the media, was built upon the belief that reductions in regulations and taxes would allow the economy to rebound. Thus, new economic policies were drawn along lines that were very different from those of preceding governments in their theoretical and political origins (OECD 1982, 9).

The first budget the new president sent to Congress proposed a $750 billion tax cut, built around a 30 percent reduction in federal income tax over three years (Jones 1995, 597). It was bold and original, the largest tax reduction in US history (Peterson and Rom 1988, 212). The administration also reduced spending on unemployment benefits programmes, job training programmes, public works and trade adjustment assistance-benefits by $11 billion. (Jones 1995, 597). These were all moves advocated by David Stockman at the Office of Management and Budget as a means of cutting taxes, increasing defence expenditure and balancing the budget (Peele 1990, 37). For Stockman this marked a clear break with past policy. Middle and working class Americans,

---

who had organised ‘tax revolts’ from Massachusetts to California, applauded this policy (Jones 1995, 597).

The new administration sought to reduce regulation across the economy and towards that end it abolished the Council on Wage and Price Stability (OECD 1982, 24). Following Reagan's election economic policy instrument settings, the instruments of economic policy, and the hierarchy of goals behind economic policy, all changed. This transformation in economic policy endured into the administrations of Reagan’s successors. As such, D’Souza (1997, 85) regards Reagan’s programme for the economy as the most ambitious in the half century following the Great Depression.

Wallison (2003, 15-16) argues that Reagan, coming as he did with a fully developed philosophy of government, represented a set of ideas that reformulated Republican policy to tap into traditional American values – private sector based economic growth, and individual opportunity. In addition to reorientating the GOP, he persuaded Americans that there was another way to think about their economy and government. This resulted in the radical shift in economic policy that lay at the heart of the "Reagan Revolution" (Weatherford and McDonnell 2005, 1). For Wallison (2003, 14) this marked a historic turning point in the US, even arguing that the Republicans’ 1994 takeover of Congress was largely based on Reagan’s enduring ideas. Reagan’s economic policies changed the economic and political landscape of 1980s America, and an examination of the 1990s shows that the thrust of these policies remained essentially intact over a decade later (Busch 2005, 41).

A severe economic crisis led policy entrepreneurs, and outside influences, to contest the viability of extant economic policies. These attacks on extant policy led to the collapse of the ideas underlying it. In this environment, an entrepreneurial network of policy entrepreneurs advocated a replacement set of ideas: monetarism. Political entrepreneur Ronald Reagan, willing to promote monetarism as an alternative approach to running the economy, managed to consolidate the entrepreneurial network advocating this new economic orthodoxy, resulting in ideational change. Following Reagan’s election as president he implemented a third order change (paradigm shift) (see Figure 3) in macro-economic policy (Hall 1993). Thus, a macro-economic crisis, the initiation of a
policy debate, ideational change, and a change of government, all contributed to the paradigm shift in economic policy that took place in America after 1981. However, the crucial element here was Ronald Reagan. Acting as the archetypal political entrepreneur, after consolidating policy entrepreneurs around a new economic ideational structure, he was willing to champion these ideas once in power, injecting them into the political environment. This led directly to the radical change in macro-economic policy.

**Conclusion**

This paper sought to uncover the inner mechanisms of policy change and specifically, how ideas enter the political arena to enact change. It argues that reliance on exogenous shocks to account for policy change is too simplistic and fails to explain the absence of change in the wake of a crisis. The central thesis was that the introduction of new ideas into the policy environment, and their transformation into policy, was due to the activities of “entrepreneurial networks” of policy entrepreneurs, with political entrepreneurs at their head. The entrepreneurial network is, as Schumpeter argued in relation to economic entrepreneurs, a vibrant endogenous driver of creative destruction, where new policies are formed to replace old and failing ones.

The cases examined were Sweden in the mid 1970s and the US at the start of the 1980s. In each case we witnessed economic crisis, criticisms of existing
economic policy, resultant policy debates, changes of government and political leaders. In the case of Sweden there was no economic ideational change, whereas in the US there was. While ideational collapse occurred in Sweden, policy entrepreneurs, lacking a political entrepreneur, failed to consolidate around a viable alternative idea. Without ideational change, there was only minor policy change. In the US, ideational collapse was followed by ideational change and subsequently third order policy change, as an entrepreneurial network of policy entrepreneurs, all advocating monetarism, consolidated around a political entrepreneur in the form of Ronald Reagan. The difference between the level of economic policy change in the US on the one hand, and Sweden on the other, was due to the presence of an entrepreneurial network and a political entrepreneur.

In Sweden, the intermediary necessary to bridge the gap between ideas of policy entrepreneurs and the political institutions was missing. While an economic crisis initiated debate on existing economic policies, and their underlying ideas, this crisis did not result in policy change. Policy change remains firmly dependent upon political entrepreneur led entrepreneurial networks consolidating around new economic ideas, which the political entrepreneur then introduces to the institutional environment. The political entrepreneur is the primary and endogenous force responsible for policy change.

However, a limitation of this paper is that the framework set out here is tested within relatively stable political/policy systems, into which political entrepreneurs can inject new ideas. An alternative would be to test this framework in the context of institutional instability, wherein the political entrepreneur might not be an endogenous entity. Such an examination would test the limitations of the framework's hypotheses, allowing for their modification and the strengthening of the framework.
